Traumatic Injury Profiles: Injuries Reported to the Texas EMS & Trauma Registries, 2014

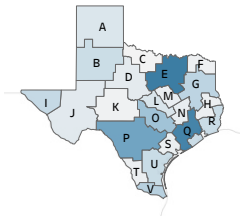
EMS & TRAUMA REGISTRIES Injury Epidemiology & Surveillance Branch

Select the year of data to view for the chart and table by using the arrows.
2014

Race/ethnicity color guide. The groups are mutually exclusive, as defined by the Texas Demographic Center.

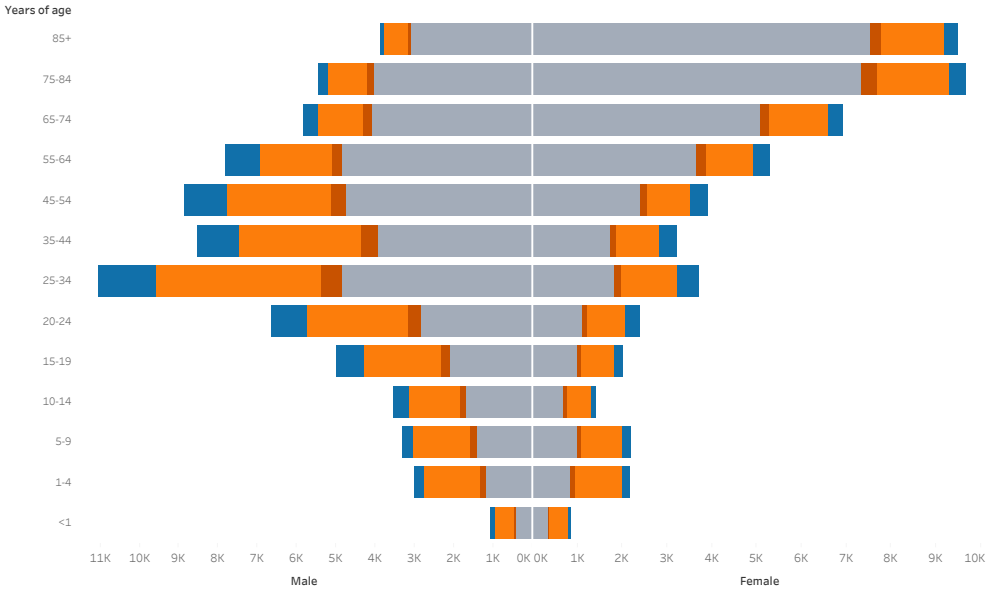
Black Other
Hispanic White

Click on a **Trauma Service Area** shown below to view area-specific information for the chart and table. Click the TSA again to return to statewide values. Hovering over the TSA will show the total number of injuries reported by entity TSA before values have been suppressed for the chart and table. Darker TSA shadings indicate more records submitted.



Injuries reported by race/ethnicity, gender, and age

Hover over the bars to view counts for each age group and race/ethnicity.



Notes
The data used for this visualizations are traumatic injuries reported by hospitals, which must report spinal cord injuries, traumatic brain injuries, and other traumatic injuries specified in Title 25, Chapter 103 of the Texas Administrative Code.

Patients who are transferred between hospitals will result in more than one record, as each hospital must independently report to the Registries. Each record is assigned a Trauma Service Area based on the reporting hospital. For these reasons, we have not calculated traumatic injury rates. Please see our Burden of Injury visualizations for injury rate information. All bar sections in the figure and table cell counts less than 5 have been suppressed.

Not all records reported to the EMS & Trauma Registries have race/ethnicity, age, gender, entity TSA, intent, and cause information. Only those records with the required information for each visualization are included. Because of incomplete reporting and suppression, the injury counts will not match across the figure, table, and TSA map.
